EM Federal Credit Union maintains an unwavering commitment to safeguarding the sensitive information and privacy of our members. In pursuit of this commitment, we have implemented a comprehensive array of security measures on our Internet server:

Firewall/IPS Protection:

Our servers are fortified behind a robust Firewall/IPS, a UNIX-based hardware product designed to fortify against external attacks. This sophisticated system proactively blocks critical ports and IP addresses, employs data signature-based packet blocking, and provides real-time alerts to promptly address potential threats.

Proprietary Server Monitoring Software:

Each server operates on proprietary software that continuously monitors for any unauthorized access attempts or potential hacking activities. In the event of a forced attack, our administrators are promptly notified, enabling the implementation of effective countermeasures to thwart such instances.

User Authentication for Administrative Activities:

All administrative activities necessitate user login and authentication. Furthermore, every administrative update is meticulously logged into files, ensuring a comprehensive audit trail for later review.

Global SSL Certificate (RSA):

To fortify the security of digital communications between our website and our valued members, all servers are equipped with a Global SSL Certificate (RSA). This encryption protocol ensures that information transmitted through applications remains impervious to decryption by third parties attempting to intercept data traversing the Internet backbone.

These meticulously selected security measures underscore EM Federal Credit Union's dedication to maintaining the utmost confidentiality and protection of our members' data in an ever-evolving digital landscape.
